API Documentation for Bayer Patient Finder Application

This document contains the backend for the Patient Finder Application. The auth-token can be a unique token a user may receive after they get logged in, and it expires after 1 day duration after logging in. For this prototype version auth-token is the same as password.

User-Specific API

Method	Route URI	Request Body/ Query (JSON)	Response Body	Details

PUT	/user
	
	/user/login
		{
		userid,
		password
		}
			{
			success: isLogged,
			userData: {
			userid,
			fullName,
			email,
			authToken
			},
			message
			}
				Provides a way for a user to gain access to the patient finder database. Start logging user's accesses for the database by the using of an unique authToken. (Security feature)
				
				authToken expires after 1 day.

POST	/user
	
	/user/register
		{
		userid,
		password,
		fullname,
		email
		}
			{
			success: isLogged,
			userData: {
			userid,
			fullName,
			email,
			authToken
			},
			message
			}
				Create a new user to the patient finder application and provides a way for a user to gain access to the patient finder database. Start logging user's accesses for the database by the using of an unique authToken. (Security feature)
				
				authToken expires after 1 day.

PUT	/user/logout	{
		userid,
		authToken
		}
			{
			success: !isLogged,
			message
			}
				Users will be logged out and the session will be ended. The user, upon logout, will no longer have their access until a new accessToken is generated by logging in.

GET	/users/preferences	{
		userid,
		authToken
		}
			{
			success,
			defaultPreferenceId,
			preferenceData:[
			userPref1:{
			userid,
			Id,
			savedName,
			jsonData
			},
			userPref2
			userPref3
			… …
				Get a list of preferences, specific to a user with userid.
				
				jsonData contains the filter values stored at mySQL end.
				More details on jsonData format is provided in the jsonData Format section
				
				Note: when a user is new to the PF system their

			] }	*default Preference is none (NULL), until they create their first preference.*

POST	/users/preferences	{
		userid,
		authToken,
		saveName,
		jsonData,
		makeDefault:bool
		}
			{
			success,
			message
			}
				Post/ Create a new preference with name, saveName, for user with userid.
				
				jsonData contains the filter values.
				More details on jsonData format is provided in the jsonData Format section

PUT	/users/preferences	{
		userid,
		auth-token,
		preferenceId,
		jsonData
		}
			{
			success,
			message
			}
				Put/ Update/ Edit an existing preference identified by preferenceId belonging to a user identified by userid.
				
				jsonData contains the filter values.
				More details on jsonData format is provided in the jsonData Format section

DELETE	/users/preferences	{
		userid,
		auth-token,
		preferenceId
		}
			{
			success,
			message
			}
				Delete the preference record identified by preferenceId belonging to a user identified by userid.

GET	/users/history	{
		userid,
		auth-token,
		rangeSeq:{
		start:1, #default
		end:50
		}
		}
			{
			userid,
			sequence:{
			start, end
			}
			historyData:[
			userHistory1:{
			historyId,
			createdOn.
			jsonData
			},
			userHistory2
			… ...
			]
			}
				Get the history of patient finder data access by a user identified with userid.

POST	/users/history	{
		userid,
		auth-token,
		jsonData
		}
			{
			success,
			message
			}
				Create a record for user Patient finder data access for generating graphs using filter values present inside jsonData.

Patient Finder Database API

Method	Route URI	Request Body/ Query (JSON)	Response Body	Details

GET	/patientfinder/labels	{
		userid,
		authToken
		}
			{
			success,
			labelData:[
			<labelrecord1>,
			< labelrecord2>,
			… …
			… ...
			]
			}
				Get all labels, values and their names from label_info that are either of type medical condition or treatments
				
				labelrecordi is a dictionary.
				{
				name, label, label_type, label_val
				}

GET	/patientfinder/values/states	{
		userid,
		authToken
		}
			{
			success,
			stateData:[
			<state1>,
			<state2>,
			…. ….
			…. ….
			]
			}
				Get all possible states from patient_info.
				
				state[i] is a dictionary.
				{
				state: value
				}

GET	/patientfinder/values/paytyp	{
		userid,
		authToken
		}
			{
			success,
			paytypData:[
			<paytyp1>,
			<paytyp2>,
			…. ….
			…. ….
			]
			}
				Get all possible payer types from patient_info.
				
				paytyp[i] is a dictionary.
				{
				paytyp: value
				}

GET	/patientfinder/values/cohort	{
		userid,
		authToken
		}
			{
			success,
			popData:[
			<pop1>,
			<pop2>,
			…. ….
			…. ….
			]
			}
				Get all possible payer types from patient_info.
				
				pop[i] is a dictionary.
				{
				pop: value
				}

GET	/patientfinder/treatments	{
		userid,
		authToken,
		jsonData
		}
			{
			success,
			group_condition,
			treatments: {
			labels,
			data
			}
			}
				Generate the PatientFinder data required for data visualization (graph) purpose. For treatments only.
				
				jsonData contains filter values

				More details on jsonData format is provided in the jsonData Format section

GET	/patientfinder/medicals	{
		userid,
		auth-token,
		jsonData
		}
			{
			success,
			group_condition,
			medical_conditions:{
			labels,
			data
			}
			}
				Generate the PatientFinder data required for data visualization (graph) purpose. For medicals only.
				
				jsonData contains filter values
				More details on jsonData format is provided in the jsonData Format section
